When a disaster or emergency occurs, it is the responsibility first of the local community and the State or Tribe to respond. However, their combined efforts at times are not sufficient to effectively address the direct results of the most serious events. These situations call for Federal assistance. The Robert T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act), 42 U.S.C. section 5121-5207, authorizes the President to provide Federal assistance to supplement State, Tribal, and local efforts. The Federal Emergency Management Agency (FEMA), a component of the Department of Homeland Security, coordinates the delivery of assistance under the law and provides grants through the Public Assistance Program to help with the extraordinary costs for response and infrastructure recovery. This Handbook explains how applicants can obtain help through the Public Assistance Program. Potential recipients of this assistance include State, Tribal, and local governments and certain types of private nonprofit organizations.

In 2001, the DoD identified performance based logistics (PBL) as the preferred weapon system support strategy. Within DoD, PBL is the purchase of performance outcomes, such as system availability, rather than the purchase of individual elements of logistics support -- such as parts, repairs, and engineering support. Although PBL initially arose from efforts to reduce support costs, questions have arisen about whether PBL has reduced support costs as originally intended. This report evaluates the extent to which DoD has used business case analyses to guide decisions related to PBL arrangements and the impact PBL arrangements have had on weapon system support costs. Includes recommendations. Charts and tables.

The Essentials of Project Management is a primer distilled from Dennis Lock's comprehensive, successful and encyclopedic textbook, Project Management, (now in its Tenth Edition). It provides a concise, straightforward account of the principles and techniques of project management, designed to meet the needs of the business manager or student. Using examples and illustrations, the author introduces the key project management procedures and explains clearly how and when to use them. The text for the new edition has been completely restructured and largely rewritten, so that the sequence now follows even more closely the life-cycle of a typical project from its earliest definition to final close-out.

This revision of the author's bestselling earlier work on cost estimating has been updated to provide currently applicable examples, data and techniques. Two new chapters have been added covering: computer tools and models for cost estimating, where to get these tools, and the features to look for; software cost estimating with special emphasis on the effect of CASE tools on software productivities and resulting software costs. A complete set of inflation tables is now included to permit conversion from any year dollars to any other year dollars from 1959 through 1997. Retains its comprehensive coverage of the elements needed to embark on a cost estimating task. Strengthened are the invaluable parts of the book which tell the estimator how to produce a competitive and credible cost estimate. Manufacturing standards for hardware and electronics are retained as are handy tables for determining the costs of engineering, design, documentation, drafting and testing.

The Managing Cost Estimating and Budgeting Module is to introduce the tools, techniques and methodologies associated with cost estimating and budgeting that have been identified as being "best tested and proven" practices and which have been found to work on "most projects, most of the time"; provide a logical or rational sequence showing when those tools or techniques would normally and customarily be used and in selected instances, show how to use those tools/techniques and/or where to find additional information on how to use or apply them.

There is a driving need for naval professionals to focus on human factors issues. The number of maritime accidents is increasing and the chief cause is human error, both by the designer and the operator. Decreasing crew size, lack of experienced operators, operations in higher sea states and fatigue worsen the situation. Automation can be a partial solution, but flawed automated systems actually contribute to accidents at sea. Up to now, there has been no overarching resource available to naval marine vehicle designers and human factors professionals which bridges the gap between the human and the machine in this context. Designers understand the marine vehicle; human factors professionals understand how a particular environment affects people. Yet neither has a practical understanding of the other's field, and thus communicating requirements and solutions is difficult. This book integrates knowledge from numerous sources as well as the advice of a panel of eight recognized experts in the fields of related research, development and operation. The result is a reference that bridges the communications gap, and stands to help enhance the design and operation of all naval marine vehicles.
